Clark and Miss Martha Bunting. The former carried out all of the observations herein recorded except those of a group comprising Wet a, Lathyrus, Quercus, Caslanea, IAlum, Tulipa, Convallaria, Amaryllis, Crinum, Sprekdx, Hccmanthus, HymenocaUis, Lcttcoiitm, Crocus, Spar-axis, Curcuma, Maranta, and Zamia, together with the temperature reactions. Miss Bunting made all of the studies included in this group as well as the important determinations of the temperatures of gclatinization. The methods employed in this research are described in ChaptcrVI (page 295), in which portion of the memoir is also explained the scheme of construction of the Curves of Rmclion-Inlcnsilies, which constitute a very important feature of this part of the report. Additional charts of a different character, which show comparatively the reaction-intcnsitics of all of the starches studied with each agent, a table of the temperatures of gclatinization of all of the starches, and also statements relating to the comparative values and individual peculiarities and certain other matters pertaining to these methods, will be found in Chapter VII (page 303). According to the literature available at the inception of this investigation it seemed questionable as to what data of value in indicating stereochochmic differences in different starches, different starch-grains, and parts of grains were to be gained by such gross histological investigations as were recorded especially by Fritzsche, Scilcicdn,...
